

Python

Input

To change different data, you have to modify the program

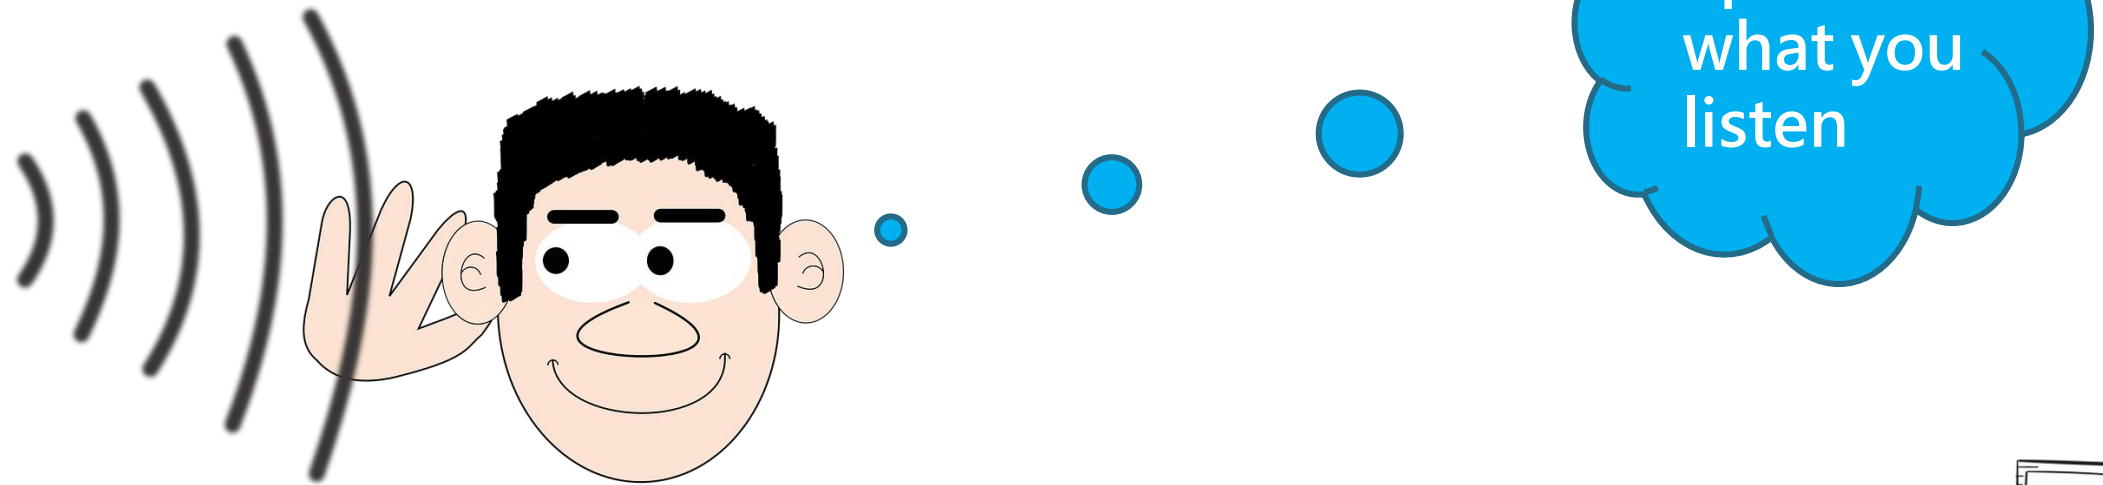

You need to change the program code each time you input different data. This is very inhuman.

```
a=3 #store the first value  
b=4 #store the second value
```

```
print ("{0}".format(a+b))
```

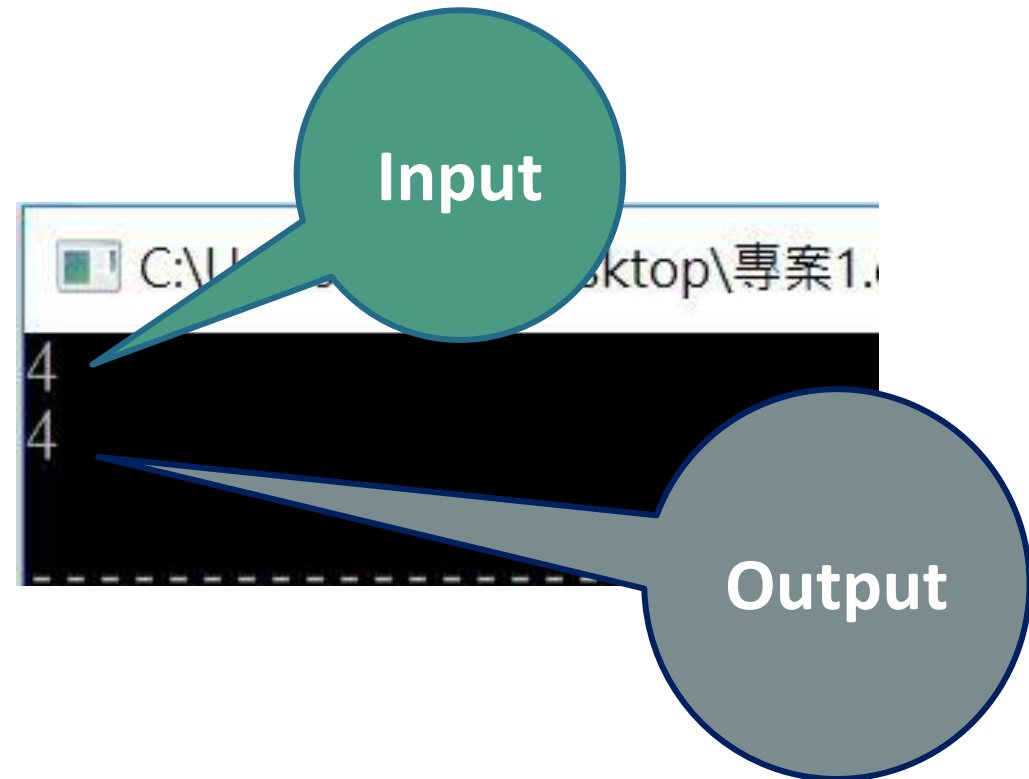

Do what the user asks

input()

printed the data entered by user

```
num = input()  
print(num)
```

This chapter focuses on `input()` data

➤ You can enter `integers`, `decimals`, `text`, and so on
