

Python

Addition

3 apples in the left hand,
4 apples in the right hand,
How many apples are there?

Exercise

Python codes

```
left = input()
right = input()
apple = left + right
print(apple)
```

```
Input :
3
4
Output :
34
```

How could it be 34?

You must transform from **text** to **number**

The use of transformation :

Transform to integer

left=**int**(input())

right= **int**(input())

```
left = input()
right = input()
apple = left + right
print(apple)
```

Input **two positive number** and print out the result of adding them together

```
1 num1=int(input())
2 num2=int(input())
3 print('{0}+{1}={2}'.format(num1,num2,num1+num2))
```

The data type obtained by input need to be transform to a numeric pattern.

```
8
7
8+7=15
python$ █
```

What if the data you get is a decimal?

It must be transformed to **decimals** (also known as **floating number**)

- `num1 = float(input())`
- `num2 = float(input())`

About 

“” It's not an equal sign.

Instead, it's an **assignment operator**, it could be read as **get**.

"=" It's not an equal sign!

- `a=3`

- `a=a+10`

- `print ("{0}".format(a))`

A does not equal to a+10.
Instead, a will get a+10

Python

Extended concepts

Output reference

```
a=3
```

```
b=4
```

```
c=a+b
```

```
print ("{0}+{1}={2}".format(a,b,c))
```

3+4=7

{0}+{1}={2}

Meaningful variables

Write a program,
3 apples in left hand, 4 apples in right hand.
How many apples are there in total?
The operation need to be printed out.

Sample input:

Sample output:

$3+4=7$

Meaningful variables that increase program readability

```
a=3
```

```
b=4
```

```
c=a+b
```

```
print ("{0}+{1}={2}".format(a,b,c))
```

$$3+4=7$$

$$\{0\}+\{1\}=\{2\}$$
